

***Discus Protector* instructions, read carefully!**

Discus Protector prevents the risk of infection by new fish of external origin. Fish from different tanks or systems are carrier of different pathogenic germs. Mixing fish from different origins may cause a so-called „x-contamination“. Often the entire old fish stock falls ill. Complex and expensive treatments are the result. Correct use presupposed, ***Discus Protector*** prevents the spread of such a disease in most cases. Your valuable fish stock will be protected.

Discus Protector is a carefully balanced mixture of high-quality anti-bacterial acting substances, which are embedded in a natural carrier substance. Dissolve the entire content of one package in an external box or bucket containing water. The new arrivals must be bathed BEFORE they come into touch with the old fish population. ***Discus Protector*** acts preventively, before a disease occurs.

Usage:

- Hold ready a cleaned empty container (e.g. a water bucket) suitable for 10 liters of water nearby the aquarium.
- Have ready a suitable net to catch and move fish.
- Prepare a timekeeper like a stopwatch, smartphone timer etc. for exact adherence to treatment duration.
- Acclimate the fish which are to be treated, to water of the new environment, as by temperature adjustment and water exchange in the transport bags.
- Fill 10 liters suitable aquarium water in the bucket or container.
- Add the entire content of one package ***Discus Protector*** into the bucket or container and dissolve it.
- Aerate the container or bucket by an air stone when treating many fish. Water movement also ensures an optimal solution of the active substances.
- Take the new fish out of the transport water and place carefully into the bucket or container without transportation water.
- The duration of treatment must take from 15 to 17 min. Control the exact length by using a stopwatch etc.
- Fish may swim beneath the water surface or they breath heavily during the treatment. Decreasing of mucosa may appear.
- Immediately after the end of treatment, put the fish carefully with the net into the aquarium.
- Turbidity of mucosa and eyes may occur, as side effect of treatment. These symptoms are normal and will disappear after one or two days.
- The transportation water must not come into contact with the aquarium water!

Important hints:

- Content of the pack only use for one single treatment
- Misapplication may cause damage of fish
- Harmful to crustaceans and invertebrates
- Optimum effect in soft and acidic water
- Toxic, keep away from children
- Do not inhale, do not swallow, protect eyes
- Wear gloves and breathing mask when required
- Do not drink used water. Do not consume in household or garden

For one single use!
